

CODIS Cold Case

One of the most memorable cases solved by CODIS as it states on the FBI website was the case of the 1990 abduction of Jennifer Schuett. In Dickinson, Texas in August Jennifer Schuett was kidnapped from her bedroom where she was sexually assaulted with her throat cut, then being found lying in a field. By a sheer miracle she survived but lost her ability to speak. Then in 2008 the case was re-opened with a fresh look with the help of the FBI's CARD system. DNA evidence that was not found during the time of the crime was sent to the FBI lab and tested. By running this DNA through CODIS a match was found and later found that Dennis Bradford was the suspect and was charged for the terrible actions committed against Jennifer. He was charged in 2009 with attempted capital murder.

The DNA found on Jennifer's clothing from the night of the incident had Bradford's DNA on it and a pair of underwear was found in a ditch with the same DNA on them and these were tested in the FBI lab around 2008-2009.

For DNA samples that are found with nobody having to do with a crime and have not been convicted of a crime. I think those should be disposed of because in a sense I feel that is an invasion of privacy and can lead to entrapment with a lot of false imprisonment.
